

FOR TEAMS THAT RUN BUILDINGS

Predict the expensive hours. SiteIQ optimizes the rest.

Energy Intelligence forecasts your grid peaks a week ahead, confirms them the day before, and optimizes HVAC every other hour — on the **thermostats and plant you already own**. **Orin**, our AI, tells you what happened, what it saved, and what to do next.

siteiqtechnologies.com · info@siteiqtechnologies.com

99%

CP prediction accuracy

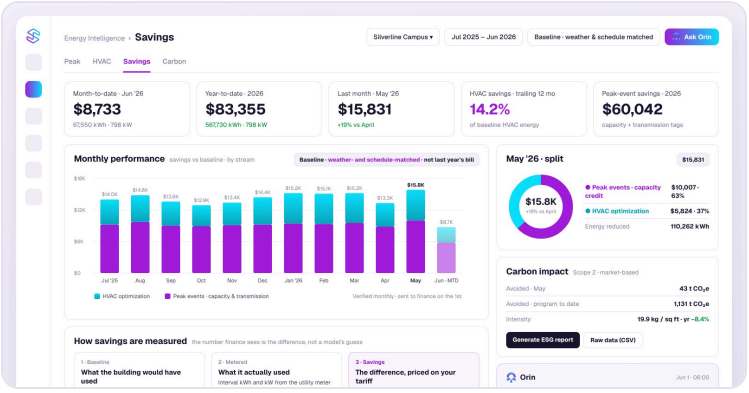

Coincident-peak calls scored against actual grid peaks over the past three years — so you act before the expensive hour, not after.

10–25%

HVAC savings

Measured against a weather- and schedule-matched baseline — not last year's bill — and shown separately from peak-event savings.

WHAT IT DOES	WHAT YOU GET
Week-ahead peak forecast, confirmed day-ahead	Act before the expensive hour, with accuracy shown against actual load
Curtailment Strategy, every action quantified	Your team decides what to shed and what to protect
AI HVAC optimization for zones and central plant	Every other hour runs cheaper, inside your comfort band
Savings measured against a matched baseline	Peak-event and HVAC savings shown separately, month by month
ESG & Carbon reporting	Scope 2, avoided carbon and a board-ready report, one click

SAVINGS

Know what changed — and what it was worth.

Energy reduction → cost savings → carbon impact → ESG report

- **Month by month, by stream** — HVAC optimization and peak-event credits, each against a matched baseline.
- **Curtailment Strategy, built with your team** — every action quantified by kW, ramp time and comfort impact; you choose what to arm.
- **Carbon in the same view** — avoided CO_2e, with a board-ready ESG report one click away.

One platform

for peak forecasting, HVAC optimization and ESG reporting

Two paths

smart thermostats for the zones, an edge controller for the plant

Every hour

the expensive ones predicted, all the others optimized

Start with one building. Prove it in one peak season. Then decide.
